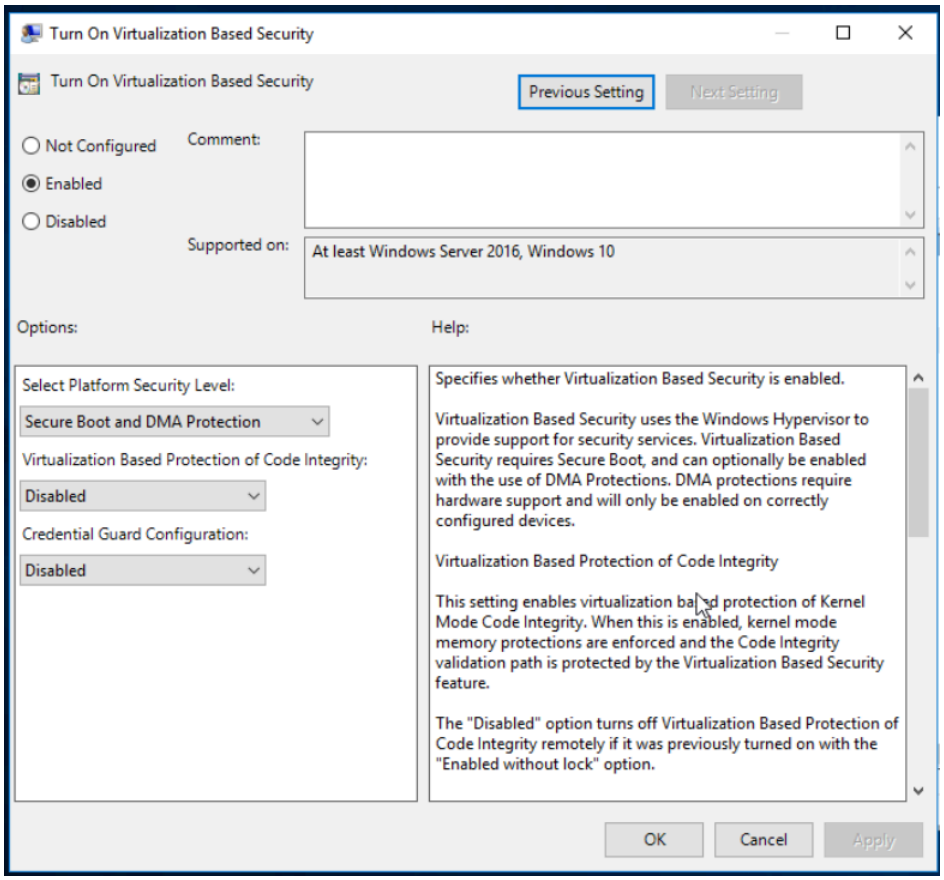
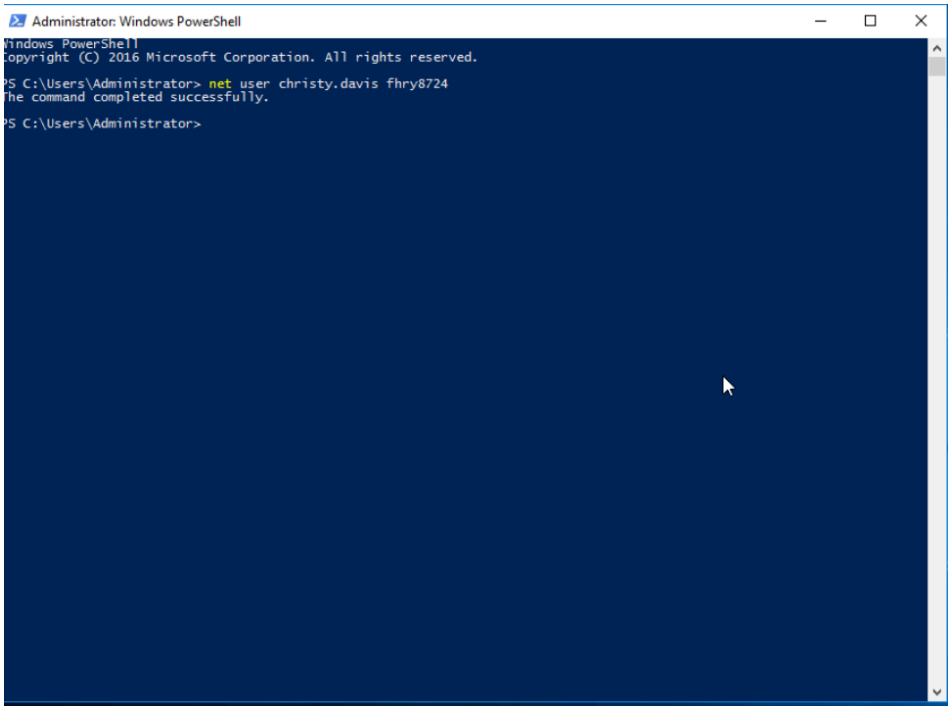
- **All of our flags were captured**.
  AD VM: The AD System 32 flag was taken. This was done by the attackers gaining administrator level access to VM. This could have been related to security vulnerabilities commonly found in the active directory, such as the lsass.exe program, which is pretty vulnerable. I turned on Virtualization Based Security to mitigate this.



I also changed the password for a vulnerable user (who is an administrator)



DB Flag Taken - My flag was taken since a red team member was able to get into a user (richard) and was able to access mysql and change all PRIVILEGES to ALL ACCESS and was able to edit a lot of stuff like user permissions and added an insider user to be able to get in and capture my flag. I tried upgrading

```
mysql> SELECT user, Host FROM mysql.user;
+------------------+-----------+
| user             | Host      |
+------------------+-----------+
| cdc              | %         |
| richard          | %         |
| debian-sys-maint | localhost |
| mysql.session    | localhost |
| mysql.sys        | localhost |
| root             | localhost |
+------------------+-----------+
6 rows in set (0.00 sec)
```

LP- there was a user that there was on my VM and i also told my AD partner to change the passwords because red team may have compromised it

```
PS C:\Users\Administrator> query user
 USERNAME              SESSIONNAME        ID  STATE   IDLE TIME  LOGON TIME
>administrator         console             1  Active      none   4/18/2026 3:55 PM
 christy.davis         rdp-tcp#28          2  Active         8   4/25/2026 11:32 AM

PS C:\Users\Administrator> logoff 2

PS C:\Users\Administrator> query user
 USERNAME              SESSIONNAME        ID  STATE   IDLE TIME  LOGON TIME
>administrator         console             1  Active      none   4/18/2026 3:55 PM
```

WMS

- jacqueline and christy users were logged in through red team ports.
- Blocked addresses and killed red team session

```
wtmp begins Sat Apr  4 22:14:33 2026
