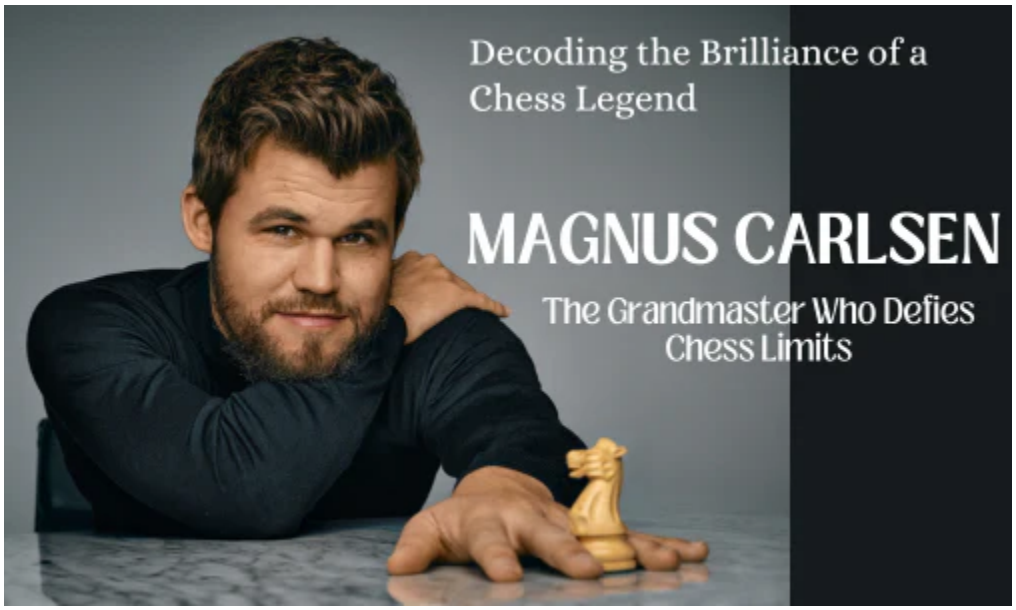
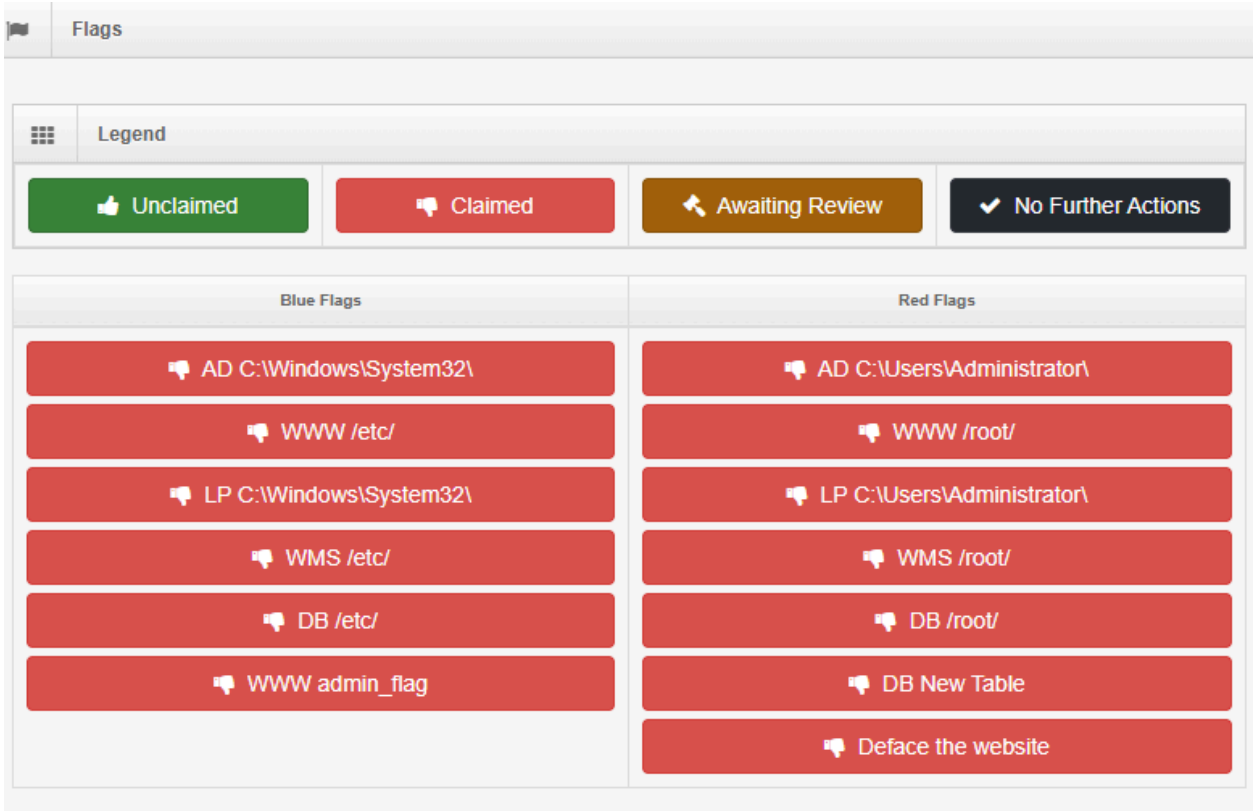
Intrusion Report
Team 11
The Grand-Master Association



Initial Assessment



We're cooked.

Label Printer

```
Administrator            Adminsitrator            cdc
DefaultAccount           Guest                    WDAGUtilityAccount
The command completed successfully.
```

Our LP only had Administrator as an account when we started. Obviously, more users were created such as the second administrator and cdc.

Event 4624, Microsoft Windows security auditing.

General Details

Security ID:	TEAM11\Guest
Account Name:	Guest
Account Domain:	TEAM11

Log Name:	Security		
Source:	Microsoft Windows security	Logged:	4/25/2026 11:27:35 AM

At 11:27 AM, the user “guest” logged onto our servers. This was approximately the time that our flags were taken.

Event 4672, Microsoft Windows security auditing.

General Details

Special privileges assigned to new logon.

Subject:

Security ID:	LP\Administrator
Account Name:	Administrator
Account Domain:	LP
Logon ID:	0x1A0ED78C

Privileges:

SeSecurityPrivilege
SeTakeOwnershipPrivilege
SeLoadDriverPrivilege
SeBackupPrivilege
SeRestorePrivilege
SeDebugPrivilege
SeSystemEnvironmentPrivilege
SeImpersonatePrivilege
SeDelegateSessionUserImpersonatePrivilege

A special logon happened at the same time, giving the new Administrator account unrestricted privileges.

```
C:\Users\Administrator>net user cdc /delete
The command completed successfully.
```

To try and contain the damage, the extra users were deleted immediately.

```
C:\Users\Administrator>net localgroup Administrators guest /delete
```

Then, the guest account was given heavily restricted privileges.

AD

AD was the second machine to fall to red team.

```
C:\Users\Administrator>quser
 USERNAME              SESSIONNAME        ID  STATE   IDLE TIME  LOGON TIME
 christy.davis                             3  Disc         1:49  4/25/2026 9:40 AM
>administrator         console            4  Active      none   4/25/2026 11:32 AM
```

Administrator logged in at 11:32 AM. We were not the ones to log on, so we know this was red team.

```
Administrator            allison.hamilton         anna.pugh
christy.davis            craig.brown              darren.williams
david.bailey             DefaultAccount           Guest
jacqueline.elliott       jennifer.freeman         joseph.smith
krbtgt                   lori.petersen            sandra.henderson
scott.avila              travis.hebert
```

There are no extra users, so it has been narrowed down to two options. Either red team figured out the Administrator password, or they changed the permissions of a customer to give them root access. Because Administrator was the only log on in the past 2 hours, we can assume the red team found the Administrator's password or somehow managed to log on without a password. We speculate that after using guests to get into LP, they found the shadow file and brute forced the password.

WMS

```
USER     TTY      FROM             LOGIN@   IDLE   JCPU   PCPU  WHAT
root              68.32.238.119    12:08   20:28m  0.00s  0.57s sshd: root@pts/0
cdc      tty1     -                08:50    0.00s  0.43s  0.04s w
cdc@wms:/var/log$ _
```

As you can see, root logged in at 12:08 using the passwords already discussed from getting into LP. Once into LP, the passwords are in the shadow file and we have no protection from the red team. To mitigate, we changed the password on root. However, this will likely not do anything because they can easily change it back using active directory.

WWW

```
[cdc@www ~]$ w
 11:57:35 up 8 days, 23:56,  3 users,  load average: 0.47, 0.17, 0.05
USER     TTY      FROM             LOGIN@   IDLE   JCPU   PCPU WHAT
cdc      seat0    login-           16Apr26  0.00s  0.00s  0.01s /usr/libexec/gd
cdc      tty2     tty2             16Apr26  8days  1:53m  0.28s /usr/libexec/tr
root     pts/2    12.110.206.199   09:02    1:57m  0.63s  0.63s -bash
[cdc@www ~]$
```

Our WWW was taken down very quickly and efficiently, so we didn't have much time to fight it. When users were checked, we saw sign ons from cdc that weren't from our team, suggesting that the Red Team somehow got into our system through the cdc account. They completely dismantled our system and made it very hard to access anything within our WWW machine.

Database

```
cdc      tty1                      08:17    0.00s  0.20s  0.12s -bash
jennifer pts/0    49.10.219.164    12:30    1:55m  0.19s  0.01s sshd: jennifer.freeman [priv]
```

At 12:30, Jennifer (who now has administrative privileges), logged into the system using the passwords gotten from LP. With administrative privileges in AD already, it is incredibly easy to change jennifer's privileges to root. To mitigate, we changed the privileges of Jennifer. However, this will likely not do anything because they can easily change it back using active directory.
