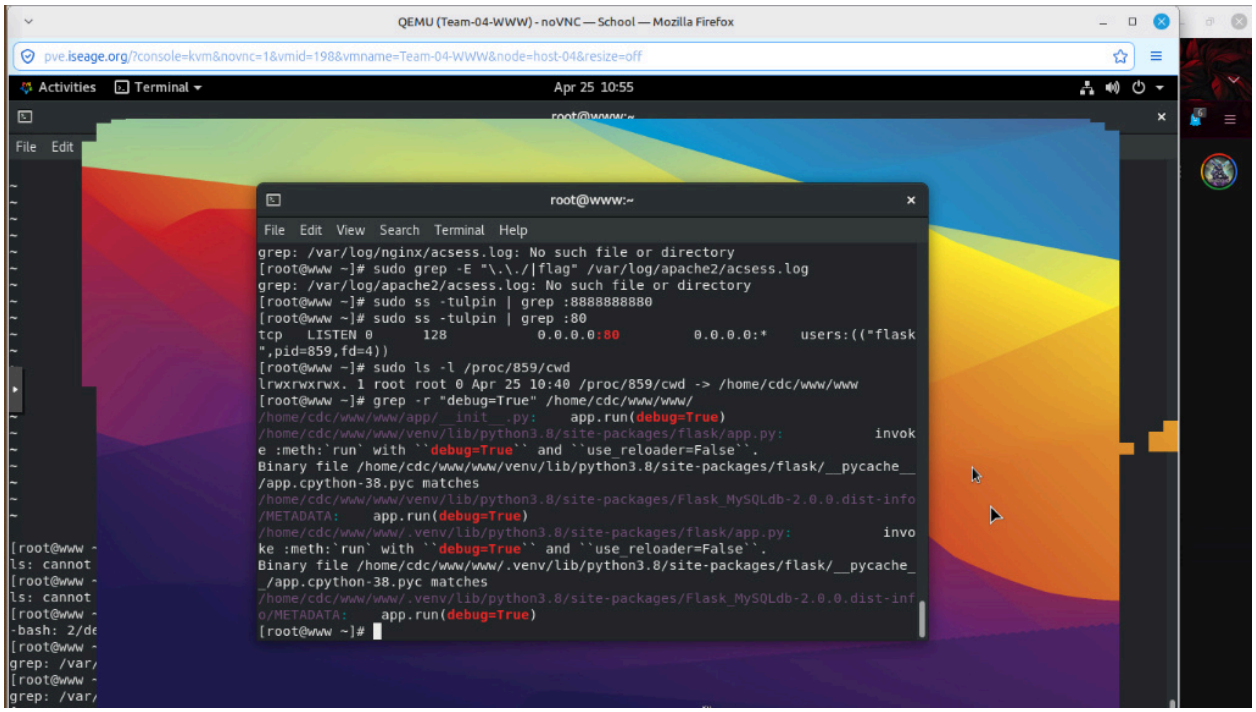
CYBER SITH 3PM INTRUSION REPORT

Team 4: Urbandale IA

WWW - vulnerabilities and remediation

Red team was able to connect to WWW through port 80, with most likely ssh, and gained access and permissions that allowed them access to the machine were they subsequently got elevated permissions that allowed them to take both our root and /etc/ flags

Remediation: Since the exploit was clearly executed from an outside source, we will configure the firewall to only allow traffic to and from the specific ports and servers necessary, so that outside traffic isn't allowed or given permissions to execute commands or files that lead to such an exploit.



Unresolve intrusions

- The admin_flag was taken and either removed or renamed
    - We know it wasn’t by the main CDC or root accounts
- Red team was able to get root access and /etc/ on AD, taking both of our flags. Users Dale and Roy got into the system where they weren't supposed to be and got elevated privileges
    - Plan on disabling or removing these users as well as locking down the ability to create users
- The red team was able to deface the website on WWW through a source other than the command line on the server
    - We’re looking into possible exploits or underlying powers available from the website.
